

TITLE _____

From Page No. _____ 3/21/2013: Sam_308: Deformation of Dry Olivine

Conical slit widths: front (upstream) 50 μ m, back 40 μ m, done by Whitaker et al.
Anvils: sintered diamonds in #1 & #4; both have a crack in them.
Spot size: estimated by previous user (Li, Weidner) as 40 x 40 μ m

0250: SAN_308_0001. med Al_2O_3 E+2 @ Calibration, 1200s
X-centering is beautiful.

#1

.005" of shims top + bot of each block

mm:			
B-T: 5.711 mm	1: 1.031	5: 1.353	9: 1.343
1-3: 5.485 mm	2: 1.270	6: 1.046	10: 1.301
2-4: 5.544 mm	3: 1.447	7: 1.077	11: 1.284
	4: 1.231	8: 1.263	12: 1.394

#2

added .002" to bot of #2, bot + top of #3

B-T: 5.716 mm	1: 1.062	5: 1.239	9: 1.361
1-3: 5.422 mm	2: 1.253	6: 1.087	10: 1.290
2-4: 5.531 mm	3: 1.332	7: 1.030	11: 1.320
	4: 1.150	8: 1.203	12: 1.230

A little better, still not perfect, go with it.

om Page No. — 3/21/13 : San 308 Continued

- ~0630 Beam dump during setup for Open Press Olivine -
Fill L_{N_2}
- 1006 0001.tif image #1
0002.med mid olivine open press. Using new Ken Baldwin GUI $z=23.70$, $y=0.053$, y range 0.1, z range 0.4
1200s; X centering checked several times beforehand, is excellent
- 1107 Close press -- surprised to see no gap in x-ray image, + response ^{at} (some) DVRTs + oil P,
also immediate response to McP. Somebody adjusted something
Logger started
McP fwd gingerly at 12%
- 1118 ~~0002.tif~~ image #2 .. concerned about symmetry of anvils & beam & center of sample
- oops, never mind - was looking at piston!
- 1140 3T 0002.tif image #2 -- A-ok. Head for 20T
- 1202 4T McP to 20%
- 68T P vs t is concave downwards. Suspect Δ in still closing the big Al block +
top of press -- ~~it was~~ I did push it in by hand, although it was very tight fit.
This is clearly so: sample is climbing in x-ray beam but anvils aren't closing much
- 1224 McP to 50%
- 1233 At 15T stop. Δ has budged -- something screwy
- 1236 P = 11T. OK -- what did I forget to close... Ans: Al block w/ air P. Oops.
- 1258 Used ~30% of McP stroke; ^{restroke,} gap opens at bottom of sample column -- suspect possible line-of-sight
blockage at top initially, based also on (too short) length of top machinable alumina.
- 1310 Gap does appear at top as McP continued to restroke, so no sight blockage.
- 1320 OK, start all over. McP restroked to 5%, top gap closed w/ electric pump, McP fwd at 20%.
- 1324 During this whole exercise, the sample compressed $\sim -20\mu\text{m}$ & lengthened (just now) by $\sim +12\mu\text{m}$.
It is now getting shorter for sure...
- 1536 Now at 1100°C, ~~Sample really strained a lot (!), maybe ~12% [uncertain because pixels not~~
1546 Oops -- that was the piston. Sample A-ok, shortened < 2% yet calibrated]
- 1554 Calibrate image: 484 pixels/mm, using ~~monitor~~ monitor, ruler, & table-z; $\sim 130\text{mm}$ [same on monitor
